

ABSTRACT OF THE DISCLOSURE

A user registration supporting system comprises a user-information database, a user-information providing section, and a to-be-registered information generating section, and supports a user, whose uses a multi-component product including a plurality of products 5 provided by a plurality of companies, in applying for user registration for the products. The user-information database stores user information including a plurality of data items regarding the user. The user-information providing section provides the user-information database with the user information. The to-be-registered information generating section extracts a data item required by each of the companies for the user 10 registration from the user information stored in the user-information database, and generates to-be-registered information which is used by each of the companies for the user registration. This user registration supporting system can generate the to-be-registered information for the plurality of companies at once, based on the user information.
